

Topic: How is Chinese aid primarily channeled? Is it towards nations that have poor governance, significant poverty levels, or those that maintain strong diplomatic relations with China?

Understanding determinants of Chinese aid and other forms of state financing.

Introduction: rise of a new superpower as an Aid Provider

- The literature on Chinese Official Finance points to different phases of geopolitical strategy.
 - During the period of 1956-1960, it is believed that China's motives for aid were largely **motivated by political and ideological considerations**.
 - By 1969, after the 9th National Congress, it is believed there was a shift in priority for aid. During this phase (2nd phase: 1970-1978), aid was used to garner **support for One China policy (also known as the period of checkbook diplomacy)**. It is during this period we see a lot of African countries sever their ties with Taiwan.
 - The third phase (1979-1989) is the period of reform under the leadership of PM Deng Xiaoping. **China during this period liberalized its economy and became more influential in China's aid allocation decisions (Resource driven)**.
 - The fourth period (1990-1995), this **era of Chinese aid policy was guided by the aftermath of the Tiananmen Square incident in 1989 (Buying Influence)**. After this moment, China actively sought diplomatic support and increased aid substantially to African and Latin American allies to reward their "all-weather friends".
 - China's fifth period (1996-2006), aid was reformed, introducing market-oriented principles and emphasizing linkages between aid, trade and investment (Brautigam 2009).

Why is Chinese Aid Interesting?

- The Development Assistance Committee (DAC) is the governing body of 24 countries that standardized what is considered concessional aid, Official Development Assistance (ODA) and what is not in regard to development, a residual category called Other Official Flows (OOF)
 - These standards and reporting procedure were set in place as early as 1972
 - All western power. At the time of defining Aid, China was an Aid recipient country, so they played no role in shaping this definition
- However, as China becomes an increasingly important player in the Aid game, this has provided recipient countries with another alternative set of financing.
- This new financing channel have troubled Scholars, since 1) China doesn't follow the internationally standardised rules for financing set by the DAC countries. 2) China doesn't publish data on this Aid activities
- This visible difference in Aid game has created an apple to oranges issue. That is, we cannot at face value compare the aid that China provides since the rules that govern ODA financing for DAC countries and China are different.
 - Typically, DAC countries provide loans that tied to conditions that liberalize the economy, reduce the role of governance, democratize the government and restructuring debt. Furthermore, DAC has shifted towards assisting in social sectors: education, women's health, etc..
 - China's aid takes many forms. China provides packages that bundle together finance from several different windows: some concessional and some of it market rate. Additionally, China is also known to underwrite risky loans via resources secured lending, investing in sectors DAC countries generally avoided
 - China also adopted a policy of non-interference, encouraging African countries to find political and economic models of development to suit their own particular circumstances

Data Sources

- As stated earlier, data on Chinese Official Finance is Dearth.
- To Combat this issue, College of William and Mary (aid data) and number of universities collaborated to create one of the few large database on Chinese Official finance at the project level
- The project scraped articles on project announcement and commitments from the Chinese Government, SOE, or Policy banks. This was done by looking at announcements from the likes of governments, intergovernmental organizations, non-governmental organizations, research institutions, etc..
- The current version (the most updated) has project level data from 2000 – 2017. There are 13,428 projects recorded and standardized so far. Researchers have noted Total commitments amounts, the flow class, the dispersing agency, the recipient country, and so on.
- Other data sources:
 - To complete this data set, I've collected data from the world bank that captures the characteristics of countries
 - Pulled Electoral Democracy data Index from Our World in Data (based on OWID V-Dem), that measures economic freedom in each country (proxy for high quality institutions)
 - Collected data on countries diplomatic relationship with Taiwan
 - Collected data on disasters from OCHA (reliefweb)

Literature Review

- China's official aid programme is widely misunderstood. A large reason for this lies in a lack of transparency by the Chinese government regarding their flows of official aid and other official finance. At the same time, however, considerable public information does exist (Bräutigam, 2009)
- Nielsen (2011) studying the withdrawal of AID by DAC countries shows that sudden aid shocks significantly increase the likelihood of conflict onset. By adding Chinese funding data, the results suggest that sudden withdrawals of traditional aid are only more likely to induce conflict in the absence of sufficient alternative funding from China.
- Alesina and Dollar (2000) finds that colonial past and political alliances are major determinants. a non-democratic former colony receives almost 25 dollars per capita, a democratic non-colony about 14 dollars per capita.
- Dreher (2018) ODA-like flows and grants are guided more by foreign policy interests than other types of official financing. Second, less concessional forms of official finance are influenced to a larger degree by economic considerations (H2).
- Dreher (2018) Commitments of OOF-like financing are significantly and positively correlated with trade, while this is not true for ODA-like flows. Further, they find out that Chinese ODA to Africa is strongly oriented toward poorer countries and OOF with stronger more advanced economies
- Dreher (2018) Countries that have befriended China, as measured by their voting in the UNGA, get punished for being friendlier with the West, as indicated by their UNSC membership
- Broich (2017) Chinese development finance does not systematically flow to more authoritarian countries, controlling for strategic, economic, political, institutional and geographic confounding factors.
- Cooper (2019) Chinese investment supports national economic growth and is servicing Africa's widely acknowledged infrastructure gap: a small body of rigorous evidence, largely derived from AidData datasets on Chinese investment in Africa, finds that Chinese investments have positive economic growth impacts including increases in GDP and flattening spatial inequalities.

Empirical Analysis

- I will be creating 2 different sets of equations for my research paper
 - Due to restrictions with time: I'm not able to dive deeper into the data and tease out further relationships or control for endogeneity beyond what's I've done in these two models.

Economic Model 1:

1. The first equation will be a pooled regression that will aggregate total commitments by country controlling for other potential confounders

Only one country in Africa still recognises Taiwan: Eswatini. Most of the countries converted to recognising One China Policy as its the one political condition China asks of its partners. Since almost all countries in Africa have recognised China, i use the "duration of Taiwan recognition" as a proxy for measuring newer diplomatic relationships with China

$$\log(\text{total commitment}) = \alpha + \beta_1 \text{Taiwan recognition} + \beta_2 \text{duration Rec OneChinaPol} + \beta_3 \text{Freedom Index} + \beta_4 \text{Population}(\log) + \beta_5 \text{GDP}_{\text{percapita}} + \beta_6 \text{FDI} + \beta_7 \text{NetODA percapita} + \beta_8 \text{CO2emissions} + \beta_9 X_j$$

j = other indicators (shares of fuel exports, ores and metal exports, english speaking country, Years of Diplomatic relationship with China)

	Dependent variable:
	log10(Amount (Constant USD2017))
Recognition of Taiwan	
Duration of Official Diplomatic Relations (2017 basis)	0.001 (0.010)
electdem_vdem_owid	1.311* (0.709)
log10(Population)	0.302 (0.273)
)	-0.0003** (0.0001)
Foreign_direct_investment_net inflows(% of GDP)	-0.076* (0.041)
)	0.003 (0.002)
O2_emissions(metric tons per capita)	0.353** (0.173)
Fuel_exports(% of merchandise exports)	0.015*** (0.004)
Ores_and_metals_exports(% of merchandise exports)	0.009 (0.006)

Adjusted R ²	0.117
Residual Std. Error	1.163 (df = 133)
F Statistic	2.737*** (df = 11; 133)
Note:	*p<0.1; **p<0.05; ***p<0.01

Empirical Analysis

- I will be creating 2 different sets of equations for my research paper
 - Due to restrictions with time: I'm not able to dive deeper into the data and tease out further relationships or control for endogeneity beyond what's I've done in these two models.

Economic Model 2:

2. The second equation will be similar to the first but will look to aggregate total commitments by country and time while also controlling for other potential confounders

Furthermore, in this model, it will be the same as the equation as above but we will also control for "intent", "Flow Class", "Recipient Country" and "Year"

$$\log(\text{total commitment})_{ij} = \alpha + \beta_1 \text{Recipient Country}_i + \beta_2 \text{Flow Class} + \beta_3 \text{intent} + \beta_4 \text{Year}_j + \beta_5 \text{Taiwan recognition} + \beta_6 \text{duration Rec OneChinaPol} + \beta_7 \text{Freedom Index} + \beta_8 \text{Population}(\log) + \beta_9 \text{GDP}_{\text{percapita}} + \beta_{10} \text{FDI} + \beta_{11} \text{NetODA percapita} + \beta_{12} \text{CO2emissions} + \beta_{13} X_m$$

m = other indicators (shares of fuel exports, ores and metal exports, english speaking country and draught led disaster)

Robustness Check & Further Research

- Model could be improved/strengthened in various ways:
 - Substitute different indexes for the Institutional proxy
 - Run a control for aid dependency (can be proxied Chinese OF as a share of the recipient's GNI)
 - Alternatively, there could be other factors that would improve the power of our model if we controlled for it
 - A few other comments are provided below:

Based on the data I've collated, it may be prudent to *include regional effects to see if Chinese official finance strategy is different globally versus Africa*. Furthermore, other literature *included data on countries that were UNSC voting members* and whether these countries voted along with the US on "key votes". It would be interesting to see if the magnitude of this coefficient has changed now, given that China has a higher GDP than US and political tensions between the two countries are increasing.

Leveraging the new data set that's compiled here, we can learn more about how and what has motivated Chinese Aid during the period of 2006-2017. Are there different phases within this period of time or has China shifted course?

Conclusion

- Western Scholars have traditionally labelled Chinese aid as “rouge” because it was believed that China was 1)undermining the efforts DAC countries have made in creating a stable Africa via their conditionalities
- However, because of the emergence of data, we are beginning to econometric evidence that this isn't the case
- Although China's approach to aid is different, it is providing African countries with optionality and helping building infrastructure (considered a riskier investment by DAC country partners)
